

PRE-CONSULTATION MODULE

COMPLETE FUNCTIONAL SPECIFICATION & WORKFLOW MANUAL

System: Veterinary Hospital Management System (HMS)

Scope: Triage Assessment, Patient Vitals, Timeline History & Physical Observations

1. MODULE OVERVIEW & SYSTEM OBJECTIVES

The Pre-Consultation (Triage) Module serves as the critical initial clinical assessment gateway in the Hospital Management System (HMS). Before a patient (pet) sees the attending Veterinarian, qualified clinical staff or veterinary nurses capture essential physical vitals, medical history timeline, primary complaints, and physical observations.

This module ensures standardized triage assessment, early detection of emergency or critical cases, systematic record keeping, and seamless data forwarding to the Doctor Module queue.

2. NAVIGATION ARCHITECTURE & SIDEBAR STRUCTURE

The Pre-Consultation module features a dedicated sub-navigation sidebar layout designed for rapid navigation by veterinary triage staff during busy clinic hours:

- **Pre-Consultation Dashboard:** Overview of daily statistics, pending vitals count, emergency alerts, and recent patient activity feed.
- **Pending Assessments Queue:** Live queue of patients registered at Reception awaiting initial physical vitals and triage assessment.
- **Completed Assessments Log:** Archive of pets whose vitals and assessment form have been completed and forwarded to Doctor Queue.
- **Medical History Archive:** Searchable historical repository of all past pre-consultation assessments across visits.
- **Quick Registration Wizard:** Embedded 4-step modal wizard for entering vitals, history, problem description, and observations.

3. END-TO-END WORKFLOW LIFECYCLE

The life cycle of a patient moving through the Pre-Consultation triage workflow follows a strict 5-stage progression:

- **Stage 1: Reception Check-In:** Receptionist registers the owner/pet or creates a new visit. A unique Token Number (e.g. TK-0012) is issued, and the visit stage is assigned as 'PRE_CONSULTATION'.
- **Stage 2: Pending Triage Queue:** The visit immediately appears in the Pre-Consultation 'Pending Pets' queue. Triage staff can view patient details and launch the assessment wizard.
- **Stage 3: 4-Step Assessment Wizard:** Staff complete 4 sequential steps: (1) Vitals Measurement, (2) Brief History Timeline, (3) Problem Description & Severity, (4) Physical Observations & Notes.
- **Stage 4: Doctor Queue Forwarding:** Upon clicking 'Finish & Submit', the pre-consultation status updates to 'COMPLETED', visit stage advances to 'DOCTOR', and visit status changes to 'WAITING' in doctor queue.
- **Stage 5: Archival & PDF Export:** The record is saved permanently, accessible under 'Completed Pets' and 'History', and can be generated as a formal PDF document.

4. COMPLETE PRE-CONSULTATION FIELD SPECIFICATION

The table below details every single field captured within the Pre-Consultation schema, including unit standards, data types, and clinical validations:

FIELD NAME	DATA TYPE / UNIT	DESCRIPTION & CLINICAL PURPOSE
visitId	ObjectId (Ref: Visit)	Mandatory link to the patient's active clinic visit.
petId / uniquePetId	ObjectId / String	Unique identification string and reference for the patient.
clinicId	ObjectId (Ref: Clinic)	Multi-tenant clinic scope isolation identifier.
tokenNumber	String (e.g. TK-0012)	Sequential daily queue token number.
bodyTemperature	Number (°F / °C)	Body temperature with unit selector (default °F).
heartRate	Number (bpm)	Pulse / Heart Rate in beats per minute.
respiratoryRate	Number (bpm)	Respiratory rate in breaths per minute.
bloodPressure	Object (systolic/diastolic)	Systolic and Diastolic blood pressure in mmHg.
spo2	Number (0 - 100%)	Blood oxygen saturation percentage level.
bodyWeight	Number (kg)	Current body weight of the patient in kilograms.
bcs	Number (1 - 9 Scale)	Body Condition Score standard numerical scale.
recordedBy	String	Name of the clinical staff member recording vitals.
vitalsRecordedAt	Date & Time	Exact timestamp when vitals were measured.
durationOfIllness	Object (value + unit)	Duration of problem (Days, Weeks, Months, Years).
onset	Enum (Sudden/Gradual)	Speed of onset for current medical complaint.
progression	Enum (Improving/Worsening/Stable)	Trend of symptoms over time.
previousEpisodes	Boolean + String	Has previous similar episodes occurred + description.
recentTravel	Boolean + String	Recent travel history + details.
animalContact	Boolean + String	Exposure to other animals + details.
primaryComplaint	String (Text)	Main reason for visit / primary symptom description.
associatedSymptoms	Array of Enums	Vomiting, Diarrhea, Lethargy, Coughing, Sneezing, etc.
severity	Enum (Mild/Moderate/Severe)	Triage urgency level classification.
generalDemeanour	Enum (Alert/Depressed/Anxious)	Mental status and general alertness of patient.
gaitAndPosture	String	Observations on movement, limping, posture.
visibleLesions	String	Wounds, skin lesions, swelling, or trauma marks.
eyes/nose/ear/skin	String fields	Specific organ system triage abnormalities.
staffNotes	String (Text)	Triage staff notes for attending doctor.

5. DATA INTEGRITY, PERMISSIONS & DOCUMENTATION EXPORT

Data integrity is maintained through strict validation rules (e.g. numeric ranges for blood pressure and SpO2, mandatory text checks for primary complaints). Multi-tenant isolation ensures data from one clinic is never accessible by another clinic staff.

Official PDF Assessment documents generated from this module follow formal veterinary medical record layout conventions, including header banners, patient identification boxes, structured vitals tables, triage timeline summaries, and dual staff/doctor signature blocks.
